Abstract

From simple music player applications to concerts, audio visualization enhances the ambience and overall experience of the enjoyer. In this project, we replicate a simpler version of such systems using an Arduino UNO development board, 32*8 LED dot matrix display, and a few small components. An audio signal of our interest is preprocessed and fed to one of the analogue pins of Arduino. This signal is then processed using the "ArduinoFFT" library, which splits the audio into discrete chunks and performs FFT on it. The resulting frequency spectrum is then again processed and scaled down to match the width and height of the LED display. Finally, the resulting waveform is displayed. In the end, we try to add more customizations such as different "display modes" and effects.

Implementation

Introduction

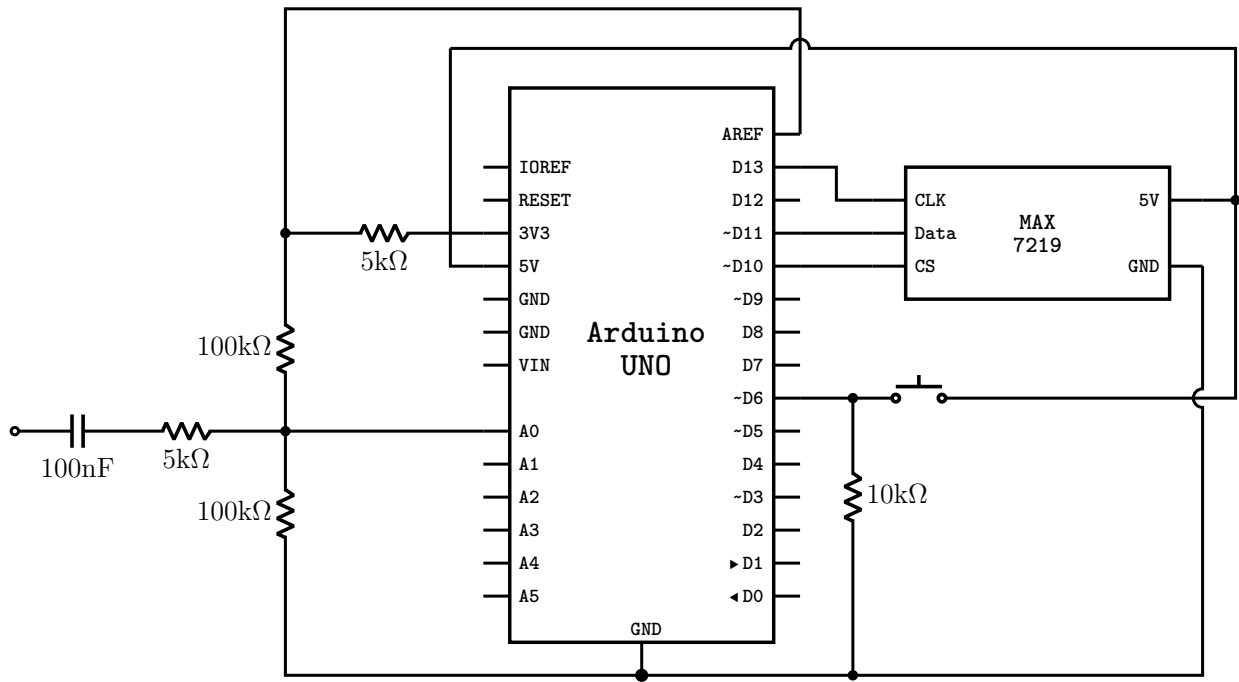

Block Diagram

Arduino UNO

Hardware

Program

```
1 void setup () {  
2     pinMode(12, LOW);  
3 }  
4  
5 void loop () {  
6  
7 }
```

Conclusion
